A recent multi-center, prospective study of 114 patients with pancreatic cystic lesions (PCLs) showed a significantly higher tissue acquisition yield with the Moray micro forceps than with FNA (83.3% vs 37.7%) respectively and a surgical concordance rate of 100%.¹

Clinically proven to support the diagnosis of pancreatic cysts...

The Moray micro forceps is designed to acquire reliable tissue samples from pancreatic cysts through an FNA needle, helping lead to a more definitive diagnosis and targeted therapy.

The single-use Moray micro forceps features...

» Serrated jaws that effectively grab tissue
» Spring sheath allowing for use in tortuous positions
» A 0.8 sheath diameter to fit through most 19 gauge FNA needles

61 PCLs were determined to be mucinous through histologic analysis from the Moray micro forceps (53.5%) versus 11 through cyst fluid cytologic analysis with EUS-FNA (9.6%)¹

For more information on the Moray micro forceps, contact your local STERIS Endoscopy representative today.
